Ash Deposition Characteristics of Coals and Blends

by

P. Hughes, L. Dell, M. Legere, R. Lastra, G. Poirier

NRCan Canada

Presentation Outline

- Introduction
 - conventional coal kinetic evaluation demonstrated strange ash behaviour
- Tests and Equipment for ash studies
- Results
 - SEM photos
- Conclusions

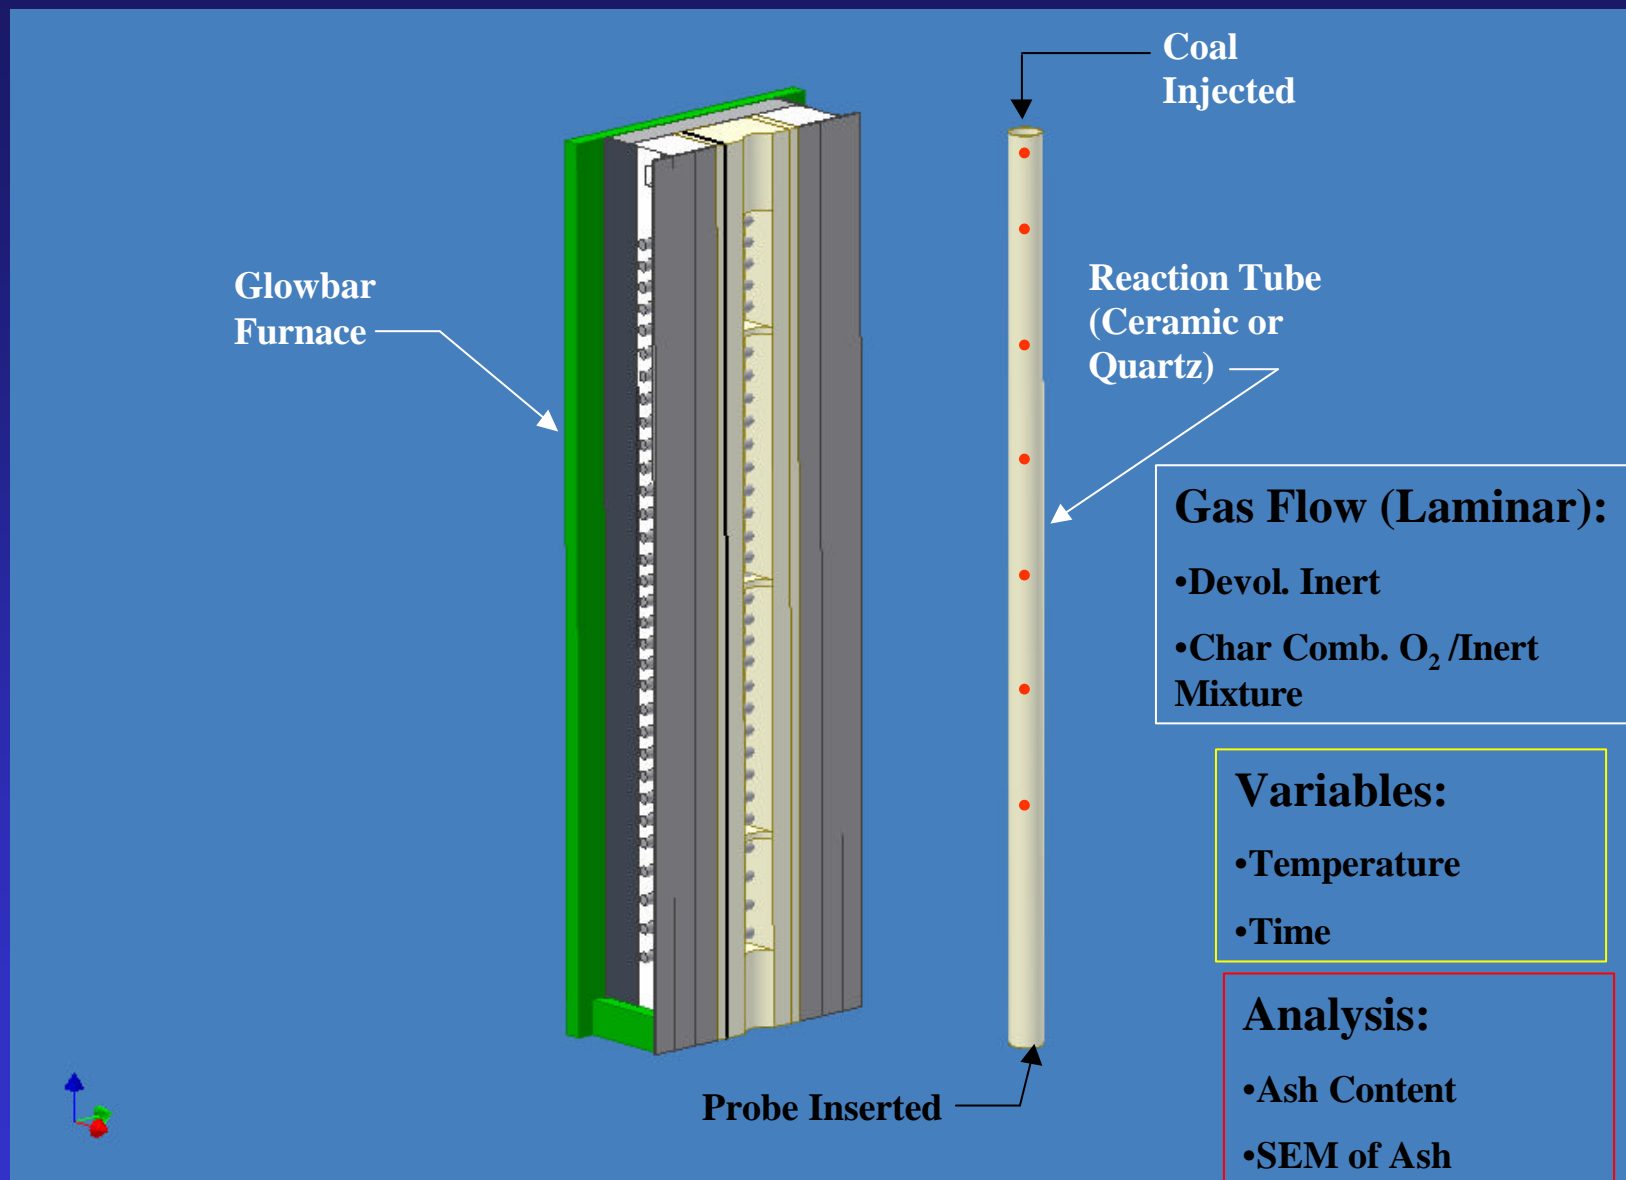

Introduction

- During coal kinetic evaluation ash component shown to melt at a low temperature
- Drop tube furnace modified to study ash transformation and deposition behaviour
- Scanning Electron Microscope (SEM) used to visualize ash characteristics
- Client was interested in effect of blending

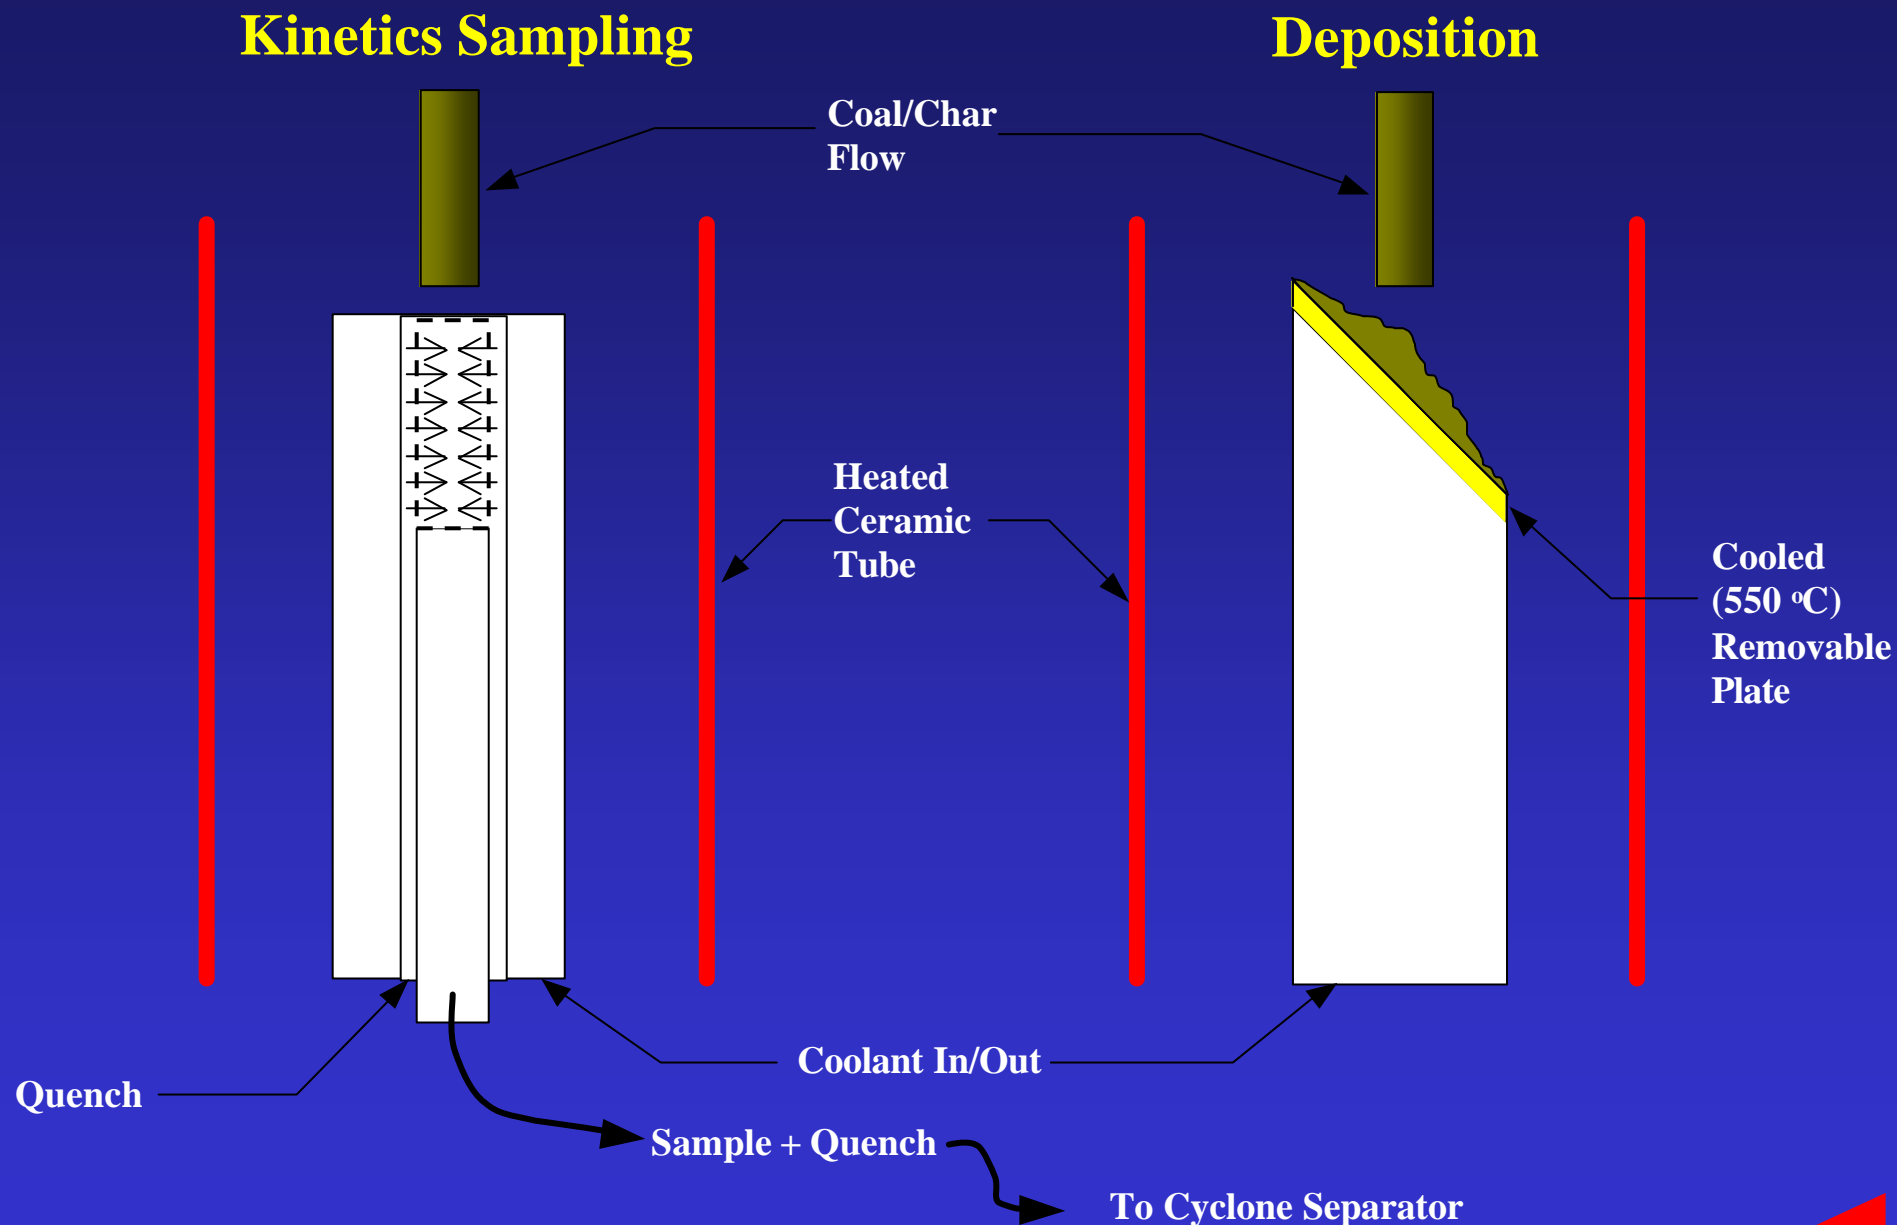

Entrained Flow Reactor

Entrained Flow Reactor

Entrained Flow Reactor Probes

Coal Analysis

Fuel	Coal A	Coal B
Moisture, wt % (as analyzed)	0.97	20.19
<u>Proximate, wt % (dry)</u>		
Ash	8.61	6.58
Volatile matter	34.24	42.44
Fixed carbon (by difference)	57.15	50.98
<u>Ultimate, wt % (dry)</u>		
Carbon	77.74	69.89
Hydrogen	4.98	4.56
Nitrogen	1.50	0.99
Sulphur	0.72	0.31
Ash	8.61	6.58
Oxygen (by difference)	6.45	17.67
<u>Heating value</u>		
Cal/gm	7712	6706
MJ/kg	32.29	28.08
BTU/lb	13881	12071

Typical Ash Analysis

Typical ASTMD1857 Ash Fusion Measurement

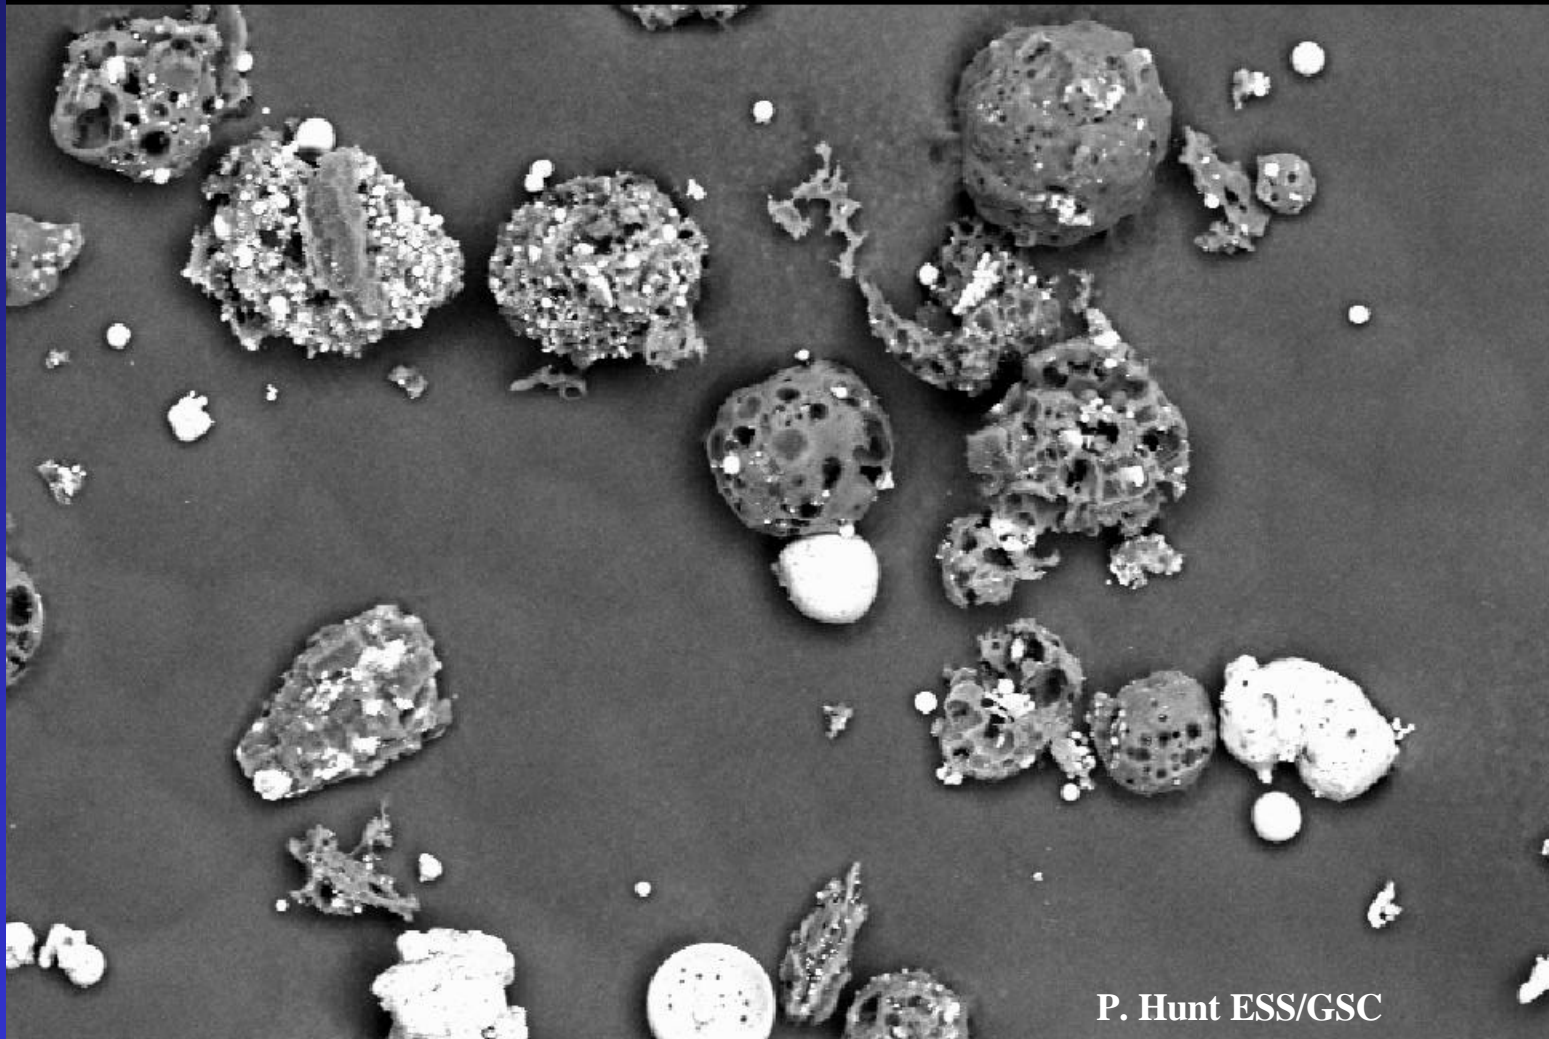

Fuel	Coal A	Coal B
<u>Ash fusibility, °C</u>		
<u>Reducing atmosphere</u>		
Initial deformation	> 1483	1141
Softening spherical	> 1483	1147
Softening hemispherical	> 1483	1149
Fluid temperature	> 1483	1155
<u>Oxidizing atmosphere</u>		
Initial deformation	> 1483	1180
Softening spherical	> 1483	1183
Softening hemispherical	> 1483	1186
Fluid temperature	> 1483	1188
<u>Ash analysis, wt %</u>		
SiO ₂	53.89	31.67
Al ₂ O ₃	27.07	14.26
Fe ₂ O ₃	5.19	5.10
TiO ₂	1.53	1.31
P ₂ O ₅	0.00	1.05
CaO	1.06	19.97
MgO	0.99	4.73
SO ₃	1.08	11.68
Na ₂ O	0.43	1.16
K ₂ O	2.51	0.44
BaO	0.13	0.54
SrO	0.14	0.34
V ₂ O ₅	-	-
NiO	-	-
MnO	0.03	0.02
Cr ₂ O ₃	-	-
Loss on fusion	2.45	4.80

Coal B: $t = 0.15$ s, $T_w = 1200$ °C, $V_{af} = 0.69$

Typical Analyses for Ash Transformation Studies

- CCSEM to determine components of the coal
- Chemical Fractionation of coal to determine the association of the mineral matter
- Entrained Flow Reactor to generate ash deposit samples and SEM for analysis

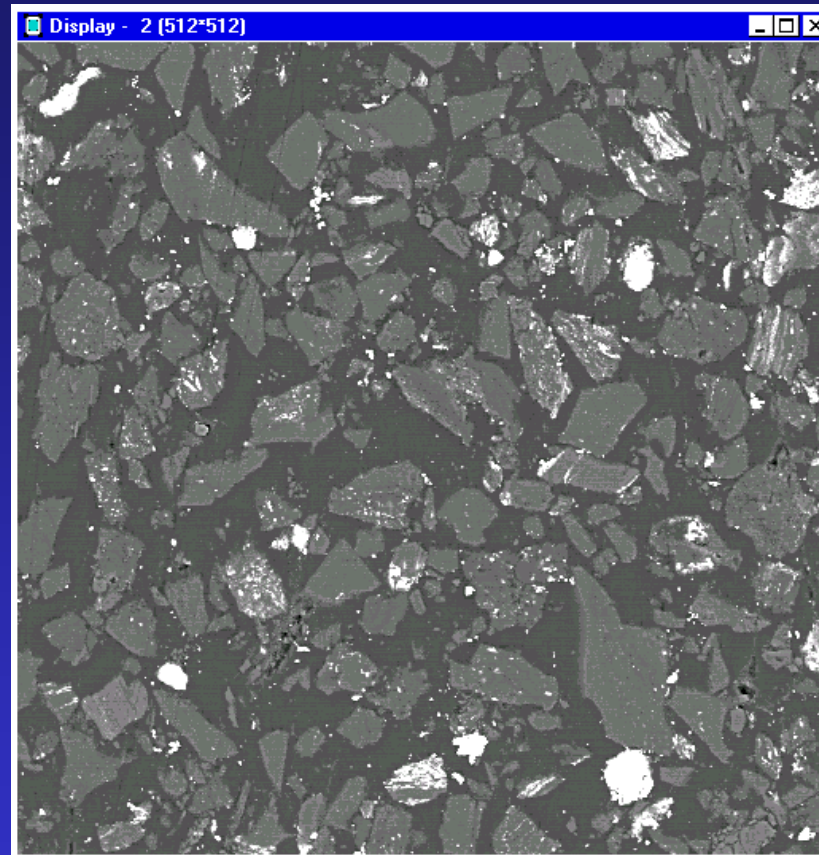

Advanced Characterization Techniques

Computer Controlled Scanning Electron Microscopy (CCSEM)

- Pulverize coal
- Place in resin, harden
- Polish puck
- CCSEM/Pattern Recognition

Can Measure:

- Particle size distribution and composition
- Included or excluded

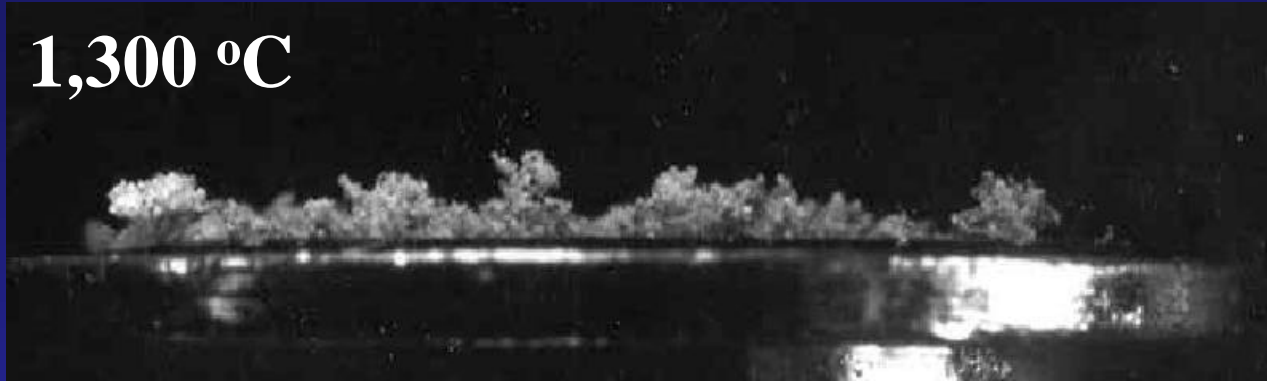

R. Lastra MMS/MTB

Advanced Characterization Techniques (cont'd)

- **Chemical Fractionation - Wet leaching-type test**
 - Association between inorganic elements and organic part
- **EFR-Deposition**
 - Detailed analysis of deposition, type and temperature dependence

Ash Deposit Study

1,300 °C

Scanning Electron Microscopy Analysis:

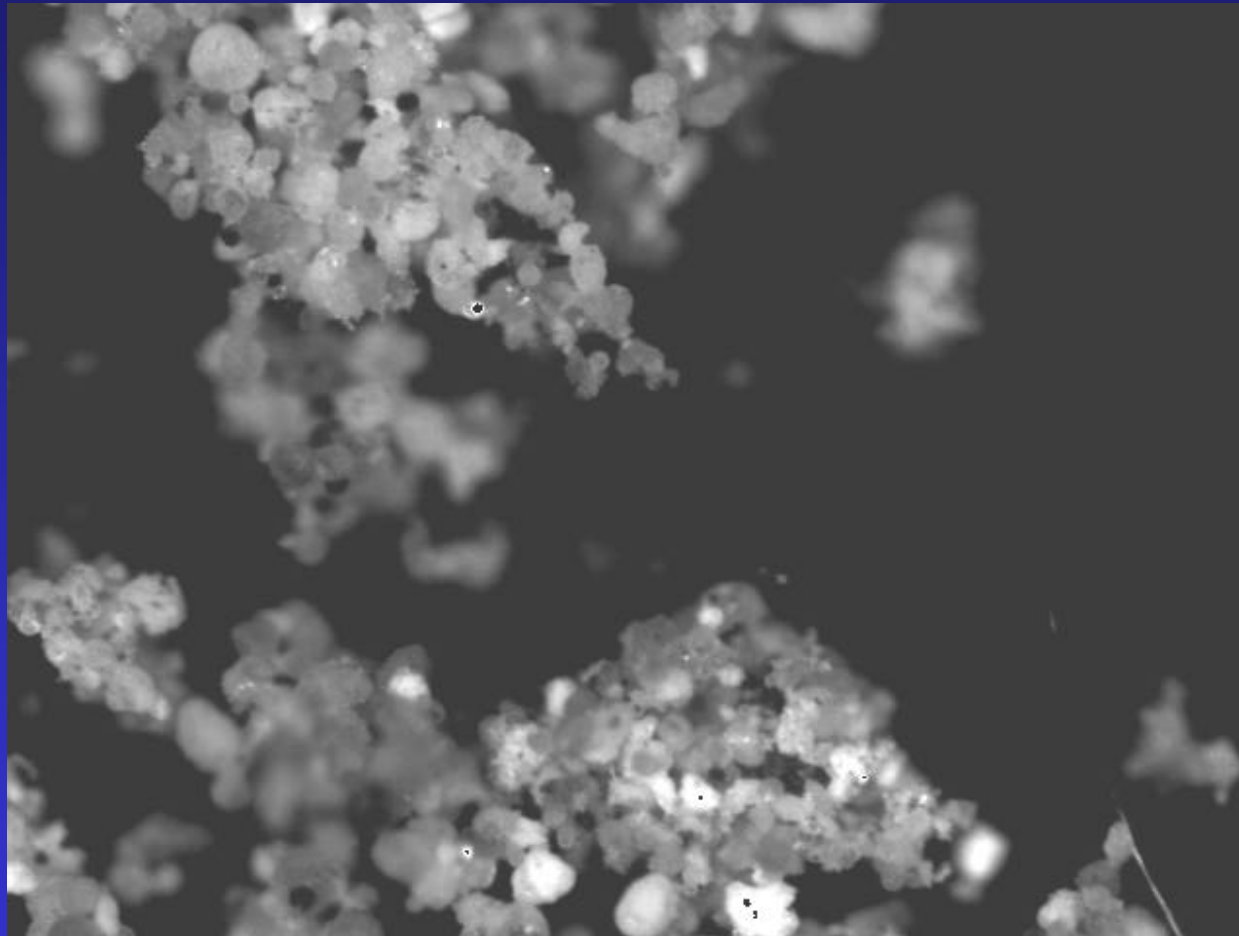

- P Determine type and composition of deposit
- P Determine the effect of temperature
- P Determine the effect of coal blending

Ash Deposit Test Conditions

- **Four Coals: Coal A, Coal B, 70% Coal A-30% Coal B, 30% Coal A-70% Coal B**
- **Seven Furnace Temperatures: 900, 1000, 1100, 1150, 1200, 1250, 1300 °C**
- **Plate at 550 °C (1000 °F)**
- **50 gm coal fed**

Bulk Analysis on Top Surface 1100 °C

Conclusions

- All the deposit samples show an accumulation of melted aluminosilicates on top of the plate; more pronounced at high temp.
- The samples from coal B showed an increasing amount of fine yellow deposit as the amount of B was increased (Calcium-Sulphur)
- The increase was not linear when blending; calcium may be limiting formation
- The potassium in Coal A causes agglomeration of aluminosilicate spheres (sinter)
- The aluminosilicate spheres from Coal B do not agglomerate as well as with Coal A

Summary Conclusions

- Blending these two coals is a bad idea because of the potassium in one and the calcium in the other
- Coal A will cause problems in the radiant sections and Coal B will cause problems in the convective pass
